The following text is adapted from James Baldwin’s 1956 novel *Giovanni’s Room*. The narrator is riding in a taxi down a street lined with food vendors and shoppers in Paris, France.

The multitude of Paris seems to be dressed in blue every day but Sunday, when, for the most part, they put on an unbelievably festive black. Here they were now, in blue, disputing, every inch, our passage, with their wagons, handtrucks, their bursting baskets carried at an angle steeply self-confident on the back.

©1956 by James Baldwin

As used in the text, what does the word “disputing” most nearly mean?

- A. Arguing about
- B. Disapproving of
- C. Asserting possession of
- D. Providing resistance to

On painter William H. Johnson’s return to the United States in 1938 after a decade in Europe, his style underwent an abrupt transformation. Turning away from landscapes painted in an expressionist style—a style that often involves using fluid, distorted shapes and thick, textured brushstrokes to express the artist’s subjective experience of reality—Johnson began painting portraits of Black Americans in a bold new way. Evocative of African sculpture and American and Scandinavian folk art, these portraits feature flat, deliberately oversimplified figures in a vibrant but limited color palette.

Which choice best describes the function of the underlined sentence in the text as a whole?

- A. It elaborates on the previous sentence’s statement about a transitional moment in Johnson’s artistic career.

It provides information about Johnson’s travels in support of a claim about his artistic influences, which is advanced in
- B. the following sentence.

It recounts a moment in Johnson’s personal life that enabled the success of his subsequent career, which is summarized
- C. in the following sentence.
- D. It presents evidence that calls into question the previous sentence’s characterization of Johnson’s artistic development.

SAT6 RW 3.6

Scholarly accounts of the Chicano movement—a movement that advocated for the social, political, and cultural empowerment of Mexican Americans and reached its zenith in the 1960s and 1970s—tend to focus on the most militant, outspoken figures in the movement, making it seem uniformly radical. Geographer Juan Herrera has shown, however, that if we shift our focus toward the way the movement manifested in comparatively low-profile neighborhood institutions and projects, we see participants espousing an array of political orientations and approaches to community activism.

Which choice best describes the function of the underlined portion in the text as a whole?

- It presents a trend in scholarship on the Chicano movement that the text claims has been reevaluated by researchers in light of Herrera’s work on the movement’s participants.

It identifies an aspect of the Chicano movement that the text implies was overemphasized by scholars due to their own political orientations.

It describes a common approach to studying the Chicano movement that, according to the text, obscures the ideological diversity of the movement’s participants.

It summarizes the conventional method for analyzing the Chicano movement, which the text suggests creates a misleading impression of the effectiveness of neighborhood institutions and projects.

Since its completion in 2014, Bosco Verticale (Vertical Forest)—a pair of residential towers in Milan, Italy, covered by vegetation—has become a striking symbol of environmental sustainability in architecture. Stefano Boeri intended his design, which features balconies that are home to hundreds of trees, to serve as a model for promoting urban biodiversity. However, the concept has faced skepticism: critics note that although the trees used in Bosco Verticale were specifically cultivated for the project, it’s too early to tell if they can thrive in this unusual setting.

According to the text, why are some critics skeptical of the concept behind Bosco Verticale?

- A. Some essential aspects of Bosco Verticale’s design are difficult to adapt to locations other than Milan.
- B. The plant life on Bosco Verticale ended up being less varied than Boeri had envisioned it would be.

The construction of Bosco Verticale was no less environmentally damaging than the construction of more conventional C. buildings is.

- D. It is unclear whether Bosco Verticale can support the plant life included in its design.

SAT6 RW 3.8

Elizabeth Asiedu has identified a negative correlation between the share of developing countries’ economies derived from natural-resource extraction and those countries’ receipts of foreign investment. This may appear counterintuitive—resource extraction requires initial investments (in extractive technology, for instance) at scales best met by multinational corporations—but Asiedu notes that natural-resource industries’ boom-bust cycle can destabilize local currencies and increase developing countries’ vulnerability to external shocks, creating levels of uncertainty to which foreign investors are typically averse.

Which choice best states the main idea of the text?

- Although it may seem surprising that foreign investment declines in developing countries as natural-resource extraction makes up a larger share of those countries’ economies, that decline happens because resource extraction requires initial investments too large for foreign investors to supply.
- Although developing countries tend to become less dependent on foreign investment as natural-resource industries make up a larger share of their economies, this change may not occur if the boom-bust cycle of those industries destabilizes local currencies or increases countries’ vulnerability to external shocks.
- Although one might expect that foreign investment would increase as natural-resource extraction makes up a larger share of developing countries’ economies, the opposite happens because heavy reliance on natural resources can lead to unattractive conditions for investors.
- Although foreign investors tend to avoid initial investments in natural-resource industries in developing countries, foreign investment may increase significantly as those industries stabilize and the risks associated with them decline.

Some astronomers searching for extraterrestrial life have proposed that atmospheric NH₃ (ammonia) can serve as a biosignature gas—an indication that a planet harbors life. Jingcheng Huang, Sara Seager, and colleagues evaluated this possibility, finding that on rocky planets, atmospheric NH₃ likely couldn’t reach detectably high levels in the absence of biological activity. But the team also found that on so-called mini-Neptunes—gas planets smaller than Neptune but with atmospheres similar to Neptune’s—atmospheric pressure and temperature can be high enough to produce atmospheric NH₃.

Based on the text, Huang, Seager, and colleagues would most likely agree with which statement about atmospheric NH₃?

- Its presence is more likely to indicate that a planet is a mini-Neptune than that the planet is a rocky planet that could support life.

A.
- Its absence from a planet that’s not a mini-Neptune indicates that the planet probably doesn’t have life.

B.
- It should be treated as a biosignature gas if detected in the atmosphere of a rocky planet but not if detected in the atmosphere of a mini-Neptune.

C.
- It doesn’t reliably reach high enough concentrations in the atmospheres of rocky planets or mini-Neptunes to be treated as a biosignature gas.

D.

SAT6 RW 3.11

Inés Ibáñez and colleagues studied a forest site in which some sugar maple trees receive periodic fertilization with nitrogen to mimic the broader trend of increasing anthropogenic nitrogen deposition in soil. Ibáñez and colleagues modeled the radial growth of the trees with and without nitrogen fertilization under three different climate scenarios (the current climate, moderate change, and extreme change). Although they found that climate change would negatively affect growth, they concluded that anthropogenic nitrogen deposition could more than offset that effect provided that change is moderate rather than extreme.

Which choice best describes data from the graph that support Ibáñez and colleagues’ conclusion?

- A. Growth with nitrogen under the current climate exceeded growth with nitrogen under moderate change, but the latter exceeded growth without nitrogen under extreme change.
- B. Growth without nitrogen under the current climate exceeded growth without nitrogen under moderate change, but the latter exceeded growth with nitrogen under extreme change.
- C. Growth with nitrogen under moderate change exceeded growth without nitrogen under moderate change, but the latter exceeded growth without nitrogen under extreme change.
- D. Growth with nitrogen under moderate change exceeded growth without nitrogen under the current climate, but the latter exceeded growth with nitrogen under extreme change.

SAT6 RW 3.12

Under normal atmospheric pressure at Earth’s surface, water molecules form a tetrahedral network stabilized by hydrogen bonds between adjacent molecules. Extreme high pressure, such as can be found in deep ocean waters, destabilizes these bonds and compresses water’s structure, allowing water molecules within organisms to permeate proteins and impede crucial biological functions; yet deep-sea organisms known as piezophiles have adapted to extreme pressure. Studies have found a positive correlation between the depths that various piezophiles inhabit and concentrations of a compound called trimethylamine N-oxide (TMAO) in their muscle tissues, which has led a team of researchers to hypothesize that TMAO reduces water’s compressibility.

Which finding, if true, would most directly support the researchers’ hypothesis?

- Water molecules are found to be impervious to TMAO even when the water molecules’ tetrahedral configuration has been
- A. distorted by high pressure.
- B. Examination of TMAO’s molecular structure shows that TMAO molecules retain their shape even as pressure increases.
- A positive correlation is found between concentrations of TMAO and the rate at which water’s molecular structure
- C. compresses as pressure increases.
- Analysis of water’s molecular structure under high pressure reveals that hydrogen bonds are more stable when TMAO is
- D. present than when it is not.

Simulated Change in Annual Aquifer Input and Irrigation Output if Precipitation Concentration Increases as Climate Models Predict

Baseline concentration of annual precipitation	% change in water entering aquifers	% change in surface water used for irrigation	% change in groundwater used for irrigation
Precipitation is currently somewhat concentrated	4.9	0.4	0.9
Precipitation is currently evenly distributed	11.0	9.0	7.9

Some climate models for the western United States predict that while total annual precipitation may remain unchanged from the present level, precipitation will become concentrated into fewer but more intense rain and snow events. University of Texas climate scientist Geeta Persad and her colleagues simulated how the amount of water entering aquifers and the amount being used for irrigation purposes would change if this were to occur. Persad and her colleagues concluded that concentration of precipitation into fewer events would result in a higher number of dry days, triggering more irrigation, but that this change in irrigation output is highly sensitive to the baseline concentration of precipitation that currently exists in an area.

Which choice best describes data from the table that support Persad and her colleagues’ conclusion?

- If baseline precipitation is somewhat concentrated, the amount of water being used for irrigation will increase 0.4% for surface water and 0.9% for groundwater, whereas the amount of water entering aquifers will increase 11.0% if baseline
- A. precipitation is evenly distributed.
- If baseline precipitation is somewhat concentrated, water use for irrigation will increase only slightly, whereas it will
- B. increase 9.0% for surface water and 7.9% for groundwater if baseline precipitation is evenly distributed.
- If baseline precipitation is somewhat concentrated, the amount of water entering aquifers will increase 4.9%, while the
- C. amount being used for irrigation will increase 0.4% for surface water and 0.9% for groundwater.
- If baseline precipitation is somewhat concentrated, water use for irrigation will decline by a small amount, whereas it will
- D. increase 11.0% for surface water and 9.0% for groundwater if baseline precipitation is evenly distributed.

In a 2013 study, Agness Gidna, José Yravedra, and Manuel Domínguez-Rodrigo compared the feeding behaviors of wild lions in Tanzania’s Tarangire National Park with those of captive lions in Spain’s Cabárceno Reserve. The researchers noted that previous studies focused on other carnivores have shown that providing animals with food at regular intervals, as is common in captive settings, may inadvertently facilitate the development of novel stereotypic (i.e., purposelessly repetitive) behaviors by reducing the need for a high degree of cognitive engagement with the environment; the researchers were therefore not altogether surprised to find that _____

Which choice most logically completes the text?

- A. bones from carcasses provided to captive lions showed signs of extensive gnawing beyond the point of nutrient extraction, whereas bones from prey hunted by wild lions did not.
- B. during feeding episodes, captive male lions showed much more aggression than did wild male lions, whereas female captive and wild lions showed similar levels of aggression.
- C. when caretakers placed food in boxes that were cognitively demanding to open, captive lions showed repeated behaviors similar to those that wild lions show when stalking prey.
- D. captive lions showed a stereotypic behavior of pacing in their enclosures as feeding times approached, whereas wild lions showed a stereotypic behavior of pacing before embarking on a hunt.
